Capture.U: Free iOS app to accompany Blue Trident

## Easier and quicker access to your data - real-time data overlaid on video

See your captures on the home page

Assess data in one of the tailored activity widgets

Capture data in a variety of ways

Capture.U is the latest iOS app from Vicon, which enables you to gather and analyse raw data immediately.

Working seamlessly with Vicon's sensors, Capture.U offers real-time data overlaid on video, allowing you to make informed decisions right where you need it – on the pitch, trackside, poolside or in the lab.

Developed to support a broad spectrum of use: from sports coaches and teams to sports scientists and biomechanist researchers, the app provides easy access to real-time information from your Blue Trident sensor.

### Capture modes

There are four capture modes that allow you to adapt the way you to gather and analyse data, to suit your specific requirements:

**1. RT (Real-time) Insight** - capture any free movement for real-time data streaming from two sensors with video overlay, playing a sound when a pre-set benchmark is achieved.

**2. Capture to iOS device** - capture free movement from up to 6 sensors with reference video data directly from the device.

**3. Capture to sensor onboard memory** - connect more than 6 sensors and capture free movements and download the data via the Desktop app.

### 4. Capture movements defined by the activity widgets for immediate real-time assessment in the field:

- **Jumping** – measures the height and velocity of a counter movement jump.
- **Sprinting** – measures velocity and time over a 40m sprint.
- **Counter rotation** – measures angles between the C7 and sacrum and global angles of the C7.
- **Swimming** – measures velocity curve of a freestyle swimmer over 100m.
- **Power meter** – records immediate maximum velocity, concentric power and force, plus velocity, power and force metrics over time.
